

**BXQ-1 Azide**

Catalog number: 2412

Unit size: 1 mg

**Product Details**

---

Storage Conditions Freeze (&lt;-15 °C), Minimize light exposure

Expiration Date 12 months upon receiving

**Chemical Properties**

---

Appearance Solid

Molecular Weight 572.63

Soluble In DMSO

**Applications**

---

Black Hole Quencher™ dyes (BHQ®) are non-fluorescent dyes mainly used for preparing FRET oligonucleotides (Black Hole Quencher™ and BHQ® are the trademarks of Biosearch). They are nearly non-fluorescent with moderate extinction coefficients. These dark quenchers are most typically used in Molecular Beacon probes in which FRET has minimal contribution to their fluorescence quenching, thus dependence on donor-acceptor spectral overlap is not significant as to other FRET probes such as FRET peptides. BHQ dyes can quench a variety of fluorophores, in particular, fluorescein derivatives such as FAM, HEX, TET, NED and JOE. This may reflect the BHQ's ability to form stable, non-fluorescent complexes with a fluorophore. BXQ-1 is chemically equivalent to BHQ®-1. BXQ-1 azide is an excellent building block for labeling alkyne-containing molecules.
